Case Study Answer Template

Agentic IT Operations Platform | 90 minutes | one per team

Team: _____ Members: _____

Deliverable 1: End-to-end architecture diagram (50%)

Draw on paper, a whiteboard or a slide and attach or photograph it. Show: all seven agents and what each owns, the tools behind MCP, memory and the RAG stores, the LLM layer, guardrails, approval gates and escalation, failure paths, observability, and the technology on each box. Number the flow for the payment-incident example (1 detect, 2 gather, 3 retrieve similar, 4 hypothesis, 5 recommend, 6 safe automation, 7 escalate if confidence is low).

Tech stack (name product and role, e.g. 'LangGraph: orchestration'): _____

Deliverable 2: How are you handling these scenarios? (30%)

Question	What we chose	Why, and what we rejected
Why multi-agent?		
Which design pattern?		
Memory strategy (short-term and long-term)?		
Human-in-the-loop boundaries?		
Tool calling strategy (including MCP)?		
Failure handling?		
Cost optimization?		
Observability of agents?		

Deliverable 3: Description of each layer in the diagram and the concept used (20%)

One row per layer in your diagram. Name the components, the technology, and the concept (for example: RAG with hybrid search, supervisor pattern, short-term state, policy-as-code, circuit breaker).

Layer	Components and technology	Concept used and why

Layer	Components and technology	Concept used and why
